Great Reasons to Install Sideshift™

- Sideshift thrusters make docking your boat as easy as parking your car.
- In addition to bow thrusters, Sideshift also offers exceptional stern thrusters allowing us to recommend the best solution for you.
- As the propeller of a Sideshift bow thruster is directly exposed to open water, it does not have to overcome the inertia of water in a tube, as do thru hull thrusters. This results in quiet operation and eliminates vibration.
- Sideshift bow thrusters do not require holes to be cut in the boat's hull below the water line.
- Sideshift bow thrusters do not create additional drag.
- Sideshift bow thrusters can be installed on boats where hull geometry or outfitting does not permit thru-hull thrusters.
- Sideshift thrusters are easier to install than traditional thrusters, and installation may be performed while the boat is in the water, substantially reducing installation time and cost.

Customer Reviews

"After our first time out with the newly installed thruster, we could not wipe the smiles off our faces. We now look forward to going out more and coming back every time."

Rob Dekam

"I am amazed at how useful they are and how much easier they make all the "fine tuning" steering corrections while at slow speeds (1-3 knots). Kudos to Sideshift for an outstanding product."

Rick Edel, WA
